WETLAND RATING FORM - EASTERN WASHINGTON

Version 2 - Updated June 2006 to increase accuracy and reproducibility among users

danie of wettand (if known).	Date of site visit:
Rated by	Trained by Ecology? YesNo Date of training
SEC: TWNSHP: RNGE: _	Is S/T/R in Appendix D? Yes No
Map of wetland ur	nit: Figure Estimated size
SU	JMMARY OF RATING
Category based on FUNCTIO	ONS provided by wetland
I II III	-
Catagory I - Caoro > -70	Score for "Water Quality" Functions
Category I = Score >=70 Category II = Score 51-69	Score for Hydrologic Functions
	Score for Habitat Functions
Category III = Score 30-50 Category IV = Score < 30	Score for Habitat I directions

Summary of basic information about the wetland unit

Wetland Type	Wetland Class
Vernal Pool	Depressional
Alkali	Riverine
Natural Heritage Wetland	Lake-fringe
Bog	Slope
Forest	
None of the above	Check if unit has multiple
	HGM classes present

Does the wetland being rated meet any of the criteria below?

If you answer YES to any of the questions below you will need to protect the wetland according to the regulations regarding the special characteristics found in the wetland.

Check List for Wetlands That Need Special Protection, and That Are Not Included in the Rating	YES	NO
SP1. Has the wetland unit been documented as a habitat for any Federally listed Threatened or Endangered animal or plant species (T/E species)?		
For the purposes of this rating system, "documented" means the wetland is on the appropriate state or federal database.		
SP2. Has the wetland unit been documented as habitat for any State listed Threatened or Endangered animal species? For the purposes of this rating system, "documented" means the wetland is on the appropriate state database. Note: Wetlands with State listed plant species are categorized as Category I Natural Heritage Wetlands (see p. 19 of data form).		
SP3. Does the wetland unit contain individuals of Priority species listed by the WDFW for the state?		
SP4. Does the wetland unit have a local significance in addition to its functions? For example, the wetland has been identified in the Shoreline Master Program, the Critical Areas Ordinance, or in a local management plan as having special significance.		

To complete the next part of the data sheet you will need to determine the Hydrogeomorphic Class of the wetland being rated.

The hydrogeomorphic classification groups wetlands into those that function in similar ways. Classifying the wetland first simplifies the questions needed to answer how it functions. The Hydrogeomorphic Class of a wetland can be determined using the key below. See p. 20 for more detailed instructions on classifying wetlands.

Classification of Vegetated Wetlands for Eastern Washington

If the hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1-7 apply, and go to Question 8.

_	The vegetated par vegetation on th	t meet both of the following criteria? t of the wetland is on the shores of a body of open water (without any e surface) at least 20 acres (8 ha) in size; te open water area is deeper than 3 m (10 ft)? YES – The wetland class is Lake-fringe (lacustrine fringe)
_	The wetland is o The water flows comes from seep banks. The water leaves NOTE: Surface very small and s	t meet all of the following criteria? In a slope (slope can be very gradual), through the wetland in one direction (unidirectional) and usually ps. It may flow subsurface, as sheetflow, or in a swale without distinct the wetland without being impounded? It water does not pond in these type of wetlands except occasionally in The shallow depressions or behind hummocks (depressions are usually and less than a foot deep). YES – The wetland class is Slope
flooding fi years to ar river is no NO -	rom that stream or renswer "yes." <i>The w</i> et flooding. go to Step 4	a valley or stream channel where it gets inundated by overbank iver? In general, the flooding should occur at least once every ten etland can contain depressions that are filled with water when the YES – The wetland class is Riverine
/I Ictha at	ntira watland unit in	a topographic depression, outside areas that are inundated by

4. Is the entire wetland unit in a topographic depression, outside areas that are inundated by overbank flooding, in which water ponds, or is saturated to the surface, at some time of the year. *This means that any outlet, if present, is higher than the interior of the wetland.*

NO – go to Step 5 **YES** – The wetland class is **Depressional**

5. Your wetland unit seems to be difficult to classify and probably contains several different HGM clases. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within your wetland. NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM Classes Within One Delineated Wetland Boundary	Class to Use for Rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake-fringe	Lake-fringe
Depressional + Riverine (riverine is within boundary of depression)	Depressional
Depressional + Lake-fringe	Depressional

If you are unable still to determine which of the above criteria apply to your wetland, or you have more than 2 HGM classes within a wetland boundary, classify the wetland as **Depressional** for the rating.

D	Depressional Wetlands WATER QUALITY FUNCTIONS - Indicators that the wetland f water quality	unctions to improve	Points (only 1 score per box)
D	D 1.0 Does the wetland unit have the <u>potential</u> to improve water	quality?	(see p. 38)
D	D 1.1 Characteristics of surface water flows out of the wetland unit: Wetland has no surface water outlet - Wetland has an intermittently flowing outlet Wetland has a highly constricted permanently flowing outlet Wetland has a permanently flowing surface outlet	points = 5 points = 3 points = 3 points = 1	
D	D 1.2 The soil 2 inches below the surface (or duff layer) is clay or organ definitions of soil types) YES NO	points = 3 points = 0	
D	D 1.3 Characteristics of persistent vegetation (emergent, shrub, and/or for Wetland has persistent, ungrazed, vegetation for > 2/3 of area Wetland has persistent, ungrazed, vegetation from 1/3 to 2/3 of area Wetland has persistent, ungrazed vegetation from 1/10 to < 1/3 of area Wetland has persistent, ungrazed vegetation <1/10 of area	points = 5 points = 3	Figure
D	D 1.4 Characteristics of seasonal ponding or inundation. This is the area of ponding that fluctuates every year. Do not count to permanently ponded. Area seasonally ponded is > ½ total area of wetland Area seasonally ponded is ¼ - ½ total area of wetland Area seasonally ponded is < ¼ total area of wetland NOTE: See text for indicators of seasonal and permanent inundations.	he area that is points = 3 points = 1 points = 0	Figure
D		Hydroperiods	
D	D 2. Does the wetland unit have the opportunity to improve water quality? Answer YES if you know or believe there are pollutants in groundwater or surface water coming into the wetland that would otherwise reduce water quality in streams, lakes or groundwater downgradient from the wetland. Note which of the following conditions provide the sources of pollutants. A unit may have pollutants coming from several sources, but any single source would qualify as opportunity. — Grazing in the wetland or within 150 ft — Untreated stormwater discharges to wetland — Tilled fields or orchards within 150 ft of wetland — A stream or culvert discharges into wetland that drains developed areas, residential areas, farmed fields, roads, or clear-cut logging — Residential, urban areas, golf courses are within 150 ft of wetland — Wetland is fed by groundwater high in phosphorus or nitrogen — Other		multiplier

	3 types 2 types 1 type	points = 2 points = 1 points = 0	
Map of Cowardin vegetation classes and areas with different height H 1.2. Is one of the vegetation types "aquatic bed?" (see p .64)	nts of emergents		
YES = 1 point $\frac{11.2.18}{11.2.18}$ NO = 0 points			
H 1.3. Surface Water (see p.65)			Figure
H 1.3.1 Does the unit have areas of "open" water (without he at least ¼ acre or 10% of its area during the spring (March – (August – end of September)? <i>Note: answer YES for Lake-fr</i> YES = 3 points & go to H 1.4 NO = go to H H 1.3.2 Does the unit have an intermittent or permanent stre along one side, over at least ¼ acre or 10% of its area, AND (answer yes only if H 1.3.1 is NO)? YES = 3 points NO = 0 points Map showir	early June) OR ringe wetlands I 1.3.2 am within its both	in early fall undaries, or getated bottom	
H 1.4. Richness of Plant Species (see p. 66)	ig areas or open	Water	
Count the number of plant species in the wetland that cover at lethe same species can be combined to meet the size threshold) You do not have to name the species. Do not include Eurasean Milfoil, reed canarygrass, purpose Phragmites, Canadian Thistle, Yellow-flag Iris, and If you counted: > 9 species points = 2 4-9 species points = 1 # of species < 4 species points = 0 purpose List species below if you wish	ole loosestrife, Ri I Salt Cedar (Tar	ıssian Olive,	

Figure H 1.5. Interspersion of habitats (see p. 67) Decided from the diagrams below whether interspersion between categories of vegetation (described in H 1.1), or categories and un-vegetated areas (can include open water or mudflats) is high, medium, low, or none. None = 0 points Low = 1 pointModerate = 2 points[Riparian braided channel] High = 3 pointsNOTE: If you have four or more vegetation categories or three vegetation categories and open water the rating is always "high". Use maps from H1.1 and H1.3 H 1.6. Special Habitat Features: (see p. 68) Check the habitat features that are present in the wetland unit. The number of checks is the number of points you put into the next column. Loose rocks larger than 4" or large, downed, woody debris (>4in. diameter) within the area of surface ponding or in stream. Cattails or bulrushes are present within the unit. Standing snags (diameter at the bottom > 4 inches) in the wetland unit or within 30 m (100ft) of the edge. Emergent or shrub vegetation in areas that are permanently inundated/ponded. The presence of "yellow flag" Iris is a good indicator of vegetation in areas permanently ponded. Stable steep banks of fine material that might be used by beaver or muskrat for denning (>45 degree slope) OR signs of recent beaver activity Invasive species cover less than 20% in each stratum of vegetation (canopy, sub-canopy, shrubs, herbaceous, moss/ground cover) $Maximum\ score\ possible=6$ **TOTAL** Potential to provide habitat Add the scores in the column above

H 2.0 Does the wetland have the opportunity to provide habitat for many species?	
H 2.0 Does the wetland have the opportunity to provide habitat for many species? H 2.1 Buffers (see p. 71) Choose the description that best represents condition of buffer of wetland unit. The highest scoring criterion that applies to the wetland is to be used in the rating. See text for definition of "undisturbed." Relatively undisturbed also means no grazing, no landscaping, no daily human use, and no structures or paving within undisturbed part of buffer. — 330ft (100 m) of relatively undisturbed vegetated areas, rocky areas, or open water >95% of circumference — 330 ft (100 m) of relatively undisturbed vegetated areas, rocky areas, or open water > 50% circumference. — 170ft (50 m) of relatively undisturbed vegetated areas, rocky areas, or open water >95% circumference. — 330ft (100 m) of relatively undisturbed vegetated areas, rocky areas, or open water > 25% circumference, — Points = 4 — 330ft (100 m) of relatively undisturbed vegetated areas, rocky areas, or open water > 25% circumference, — Points = 3 — 170ft (50 m) of relatively undisturbed vegetated areas, rocky areas, or open water for > 50% circumference. — Points = 3 — If buffer does not meet any of the criteria above — No paved areas (except paved trails) or buildings within 80ft (25 m) of wetland > 95% circumference. Light to moderate grazing, or lawns are OK. — No paved areas or buildings within 170ft (50m) of wetland for >50% circumference. — Light to moderate grazing, or lawns are OK. — Points = 2 — Heavy grazing in buffer. — Vegetated buffers are <6.6ft wide (2m) for more than 95% of the circumference (e.g. tilled fields, paving, basalt bedrock extend to edge of wetland). — Points = 0 — Buffer does not meet any of the criteria above.	Figure
Aerial photo showing buffers H 2.2 Wet Corridors (see p. 72) H 2.2.1 Is the wetland unit part of a relatively undisturbed and unbroken, > 30 ft wide, vegetated corridor at least ¼ mile long with surface water or flowing water throughout most of the year (> 9 months/yr)? (dams, heavily used gravel roads, paved roads, fields tilled to edge of stream, or pasture to edge of stream are considered breaks in the corridor). YES = 4 points (go to H 2.3) NO = go to H 2.2.2	
H 2.2.2 Is the unit part of a relatively undisturbed and unbroken, > 30 ft wide, vegetated corridor, at least ½ mile long with water flowing seasonally, OR a lake-fringe wetland without a "wet" corridor, OR a riverine wetland without a surface channel connecting to the stream?	
YES = 2 points (go to H 2.3) NO go to H $2.2.3$	
H 2.2.3 Is the wetland within a 1/2 mile of any permanent stream, seasonal stream, or lake (do not include man-made ditches)? YES = 1 point NO = 0 points	

H 2.3 Near or adjacent to other priority habitats listed by WDFW (see p. 74)	
Which of the following priority habitats are within 330ft (100m) of the wetland unit?	
NOTE: the connections do not have to be relatively undisturbed. These are DFW definitions.	
Check with your local DFW biologist if there are any questions.	
Riparian: The area adjacent to aquatic systems with flowing water that contains elements of	
both aquatic and terrestrial ecosystems which mutually influence each other.	
Aspen Stands: Pure or mixed stands of aspen greater than 2 acres.	
Cliffs: Greater than 25 ft high and occurring below 5000 ft.	
Old-growth forests: (east of Cascade crest): In general, stands will be >150 years of age,	
with 10 trees/acre that are > 21 in dbh, and 1 - 3 snags/acre > 12 -14 in diameter.	
Mature forests: Stands with average diameters exceeding 21 in dbh; crown cover may be	
less that 100%; decay, 80 - 160 years old east of the Cascade crest.	
Prairies and Steppe: Relatively undisturbed areas (as indicated by dominance of native	
plants) where grasses and/or forbs form the natural climax plant community.	
Shrub-steppe: Tracts of land consisting of plant communities with one or more layers of	
perennial grasses and a conspicuous but discontinuous layer of shrubs.	
Talus: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft, composed of	
basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be	
associated with cliffs.	
Caves: A naturally occurring cavity, recess, void, or system of interconnected passages	
Oregon white Oak: Woodlands Stands of pure oak or oak/conifer associations where	
canopy coverage of the oak component of the stand is 25%.	
Urban Natural Open Space: A priority species resides within or is adjacent to the open	
space and uses it for breeding and/or regular feeding; and/or the open space functions as a	
corridor connecting other <i>priority habitats</i> , especially those that would otherwise be	
isolated; and/or the open space is an isolated remnant of natural habitat larger than 4 ha (10	
acres) and is surrounded by urban development.	
Aspen Stands: Pure or mixed stands of aspen greater than 0.8 ha (2 acres).	
If wetland has 2 or more Priority Habitats = 4 points	
If wetland has 1 Priority Habitat = 2 points	
No Priority habitats = 0 points	
ote: All vegetated wetlands are by definition a priority habitat but are not included in this list.	
Nearby wetlands are addressed in question H 2.4)	

H 2.4 Landscape (choose the one description of the landscape around the wetland that best fits) (see p. 76) — The wetland unit is in an area where annual rainfall is less than 12 inches, and its water regime is not influenced by irrigation practices, dams, or water control structures. (Generally, this means outside boundaries of reclamation areas, irrigation district, or reservoirs) points = 5 — There are at least 3 other wetlands within ½ mile, and the connections between them are relatively undisturbed (light grazing in the connection or an open water connection along a lake shore without heavy boat traffic are OK, but connections should NOT be bisected by paved roads, fill, fields, heavy boat traffic or other development) points = 5 — There are at least 3 other wetlands within ½ mile, BUT the connections between them are disturbed? points = 2 — There is at least 1 wetland within ½ mile. points = 1 — Does not meet any of the four criteria above points = 0	
H 2 . TOTAL Score - opportunity for providing habitat Add the scores in the column above	
H 3.0 Does the wetland unit have indicators that its ability to provide habitat is reduced?	
H 3.1 Indicator of reduced habitat functions (see p. 75) Do the areas of open water in the wetland unit have a resident population of carp (see text for indicators of the presence of carp)? (NOTE: This question does not apply to reservoirs with water levels controlled by dams, such as the reservoirs on the Columbia and Snake Rivers)	Points will be subtracted
YES = -5 points NO = 0 points	
Total Score for Habitat Functions – add the points for H 1, H 2, and H 3 and record the result on p. 1	

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Please determine if the wetland unit meets the attributes described below and circle the appropriate Category. NOTE: A wetland may meet the criteria for more than one set of special characteristics. Record all those that apply. NOTE: All units should also be characterized based on their functions.

Wetland Type Check off any criteria that apply to the wetland. Circle the Category when the appropriate criteria are met.	Category
SC 1.0 Vernal pools (see p. 79)	
Is the wetland unit less than 4000 ft² , and does it meet at least two of the following criteria?	
 Its only source of water is rainfall or snowmelt from a small contributing basin and has no groundwater input Wetland plants are typically present only in the spring; the summer vegetation is typically upland annuals. NOTE: If you find perennial, "obligate", wetland plants the wetland is probably NOT a vernal pool The soil in the wetland are shallow (<1ft deep (30 cm)) and is underlain by an impermeable layer such as basalt or clay. Surface water is present for less than 120 days during the "wet" season. YES = Go to SC 1.1 NO - not a vernal pool 	
SC 1.1 Is the vernal pool relatively undisturbed in February and March?	
YES = Go to SC 1.2 $NO-not\ a\ vernal\ pool\ with\ special\ characteristics$	
SC 1.2 Is the vernal pool in an area where there are at least 3 separate aquatic resources within 0.5 miles (other wetlands, rivers, lakes etc.)? YES = Category II NO = Category III	Cat. II Cat. III
SC 2.0 Alkali wetlands (see p. 81)	
 Does the wetland unit meets one of the following two criteria? — The wetland has a conductivity > 3.0 mS/cm. — The wetland has a conductivity between 2.0 - 3.0 mS, and more than 50% of the plant cover in the wetland can be classified as "alkali" species (see Table 2 for list of plants found in alkali systems). — If the wetland is dry at the time of your field visit, the central part of the area is covered with a layer of salt. 	
OR does the wetland unit meets two of the following three sub-criteria?	
 — Salt encrustations around more than 80% of the edge of the wetland — More than ¾ of the plant cover consists of species listed on Table 2 — A pH above 9.0. All alkali wetlands have a high pH, but please note that some freshwater wetlands may also have a high pH. Thus, pH alone is not a good indicator of alkali wetlands. 	Cat. I
YES = Category I NO – not an alkali wetland	

SC 3.0 Natural Heritage Wetlands (see p. 81) Natural Heritage wetlands have been identified by the Washington Natural Heritage Program/DNR as either high quality undisturbed wetlands or wetlands that support state Threatened, Endangered, or Sensitive plant species. SC 3.1 Is the wetland unit being rated in a Section/Township/Range that contains a Natural Heritage wetland? (this question is used to screen out most sites before you need to contact WNHP/DNR) S/T/R information from Appendix D or accessed from WNHP/DNR database YES contact WNHP/DNR (see p. 79) and go to SC 3.2 NO	
SC 3.2 Has DNR identified the wetland unit as a high quality undisturbed wetland or as or as a site with state threatened, endangered, or sensitive plant species? YES = Category I NO -not a natural heritage wetland	Cat. I
SC 4.0 Bogs (see p. 82)	
Does the wetland unit (or any part of the wetland unit) meet both the criteria for soils and vegetation in bogs. Use the key below to identify if the wetland is a bog. If you answer yes you will still need to rate the wetland based on its functions.	
SC 4.1. Does the wetland unit have organic soil horizons (i.e. layers of organic soil), either peats or mucks, that compose 16 inches or more of the first 32 inches of the soil profile? (See Appendix B for a field key to identify organic soils)? Yes - go to SC 4.3 No - go to SC 4.2 SC 4.2. Does the unit have organic soils, either peats or mucks that are less than 16 inches deep over bedrock or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?? Yes - go to SC 4.3 No - Is not a bog for rating SC 4.3. Does the wetland unit have more than 70% cover of mosses at ground level in any area within its boundaries, AND other plants, if present, consist of the "bog" species listed in Table 3 as a significant component of the vegetation (more than 30% of the total shrub and herbaceous cover consists of species in Table 3)?	Cat. I
Yes – Category I bog No - go to Q. 4.4	Cat. I
NOTE: If you are uncertain about the extent of mosses in the understory you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16" deep. If the pH is less than 5.0 and the "bog" plant species in Table 3 are present, the wetland is a bog.	
SC 4.4. Is the unit, or any part of it, forested (> 30% cover) with sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Englemann's spruce, or western white pine, WITH any of the species (or combination of species) on the bog species plant list in Table 3 as a significant component of the ground cover (> 30% coverage of the total shrub/herbaceous cover)? Yes – Category I, bog	Cat. I
cover)? Yes – Category I bog NO	

SC 5.0 Forested Wetlands (see p. 85)		
Does the wetland unit have an area of forest (you should have identified a		
forested class, if present, in question H 1.1) rooted within its boundary that		
meet at least one of the following three criteria?		
— The wetland is within the "100 year" floodplain of a river or stream		
— aspen (<i>Populus tremuloides</i>) are a dominant or co-dominant of the "woody" vegetation. (<i>Dominants means it represents at least 50% of the</i>		
cover of woody species, co-dominant means it represents at least 20% of		
the total cover of woody species)		
— There is at least ¼ acre of trees (even in wetlands smaller than 2.5 acres)		
that are "mature" or "old-growth" according to the definitions for these		
priority habitats developed by WDFW (see p. 83)		
YES = go to SC 5.1 NO —not a forested wetland with special characteristics		
SC 5.1 Does the wetland unit have a forest canopy where more than 50% of the		
tree species (by cover) are slow growing native trees Slow growing trees are: western red cedar (<i>Thuja plicata</i>), Alaska yellow		
cedar (<i>Chamaecyparis nootkatensis</i>), pine spp. mostly "white" pine (<i>Pinus</i>		
monticola), western hemlock (Tsuga heterophylla), Englemann spruce (Picea		
engelmannii).		
$YES = Category I \qquad \qquad NO = go to SC 5.2$	Cat. I	
SC 5.2 Does the unit have areas where aspen (<i>Populus tremuloides</i>) are a		
dominant or co-dominant species?	Cat. I	
$YES = Category I \qquad NO = go to SC 5.3$		
SC 5.3 Does the wetland unit have areas with a forest canopy where more than		
50% of the tree species (by cover) are fast growing species. Fast growing species are:		
Alders – red (Alnus rubra), thin-leaf (A. tenuifolia)		
Cottonwoods – narrow-leaf (Populus angustifolia), black (P. balsamifera)		
Willows- peach-leaf (Salix amygdaloides), Sitka (S. sitchensis), Pacific (S.		
lasiandra), Aspen - (Populus tremuloides), Water Birch (Betula occidentalis)		
$YES = Category II \qquad \qquad NO = go to SC 5.5$	Cat. II	
SC 5.5 In the forested common and of the westless levisles the "100 error Cl. 1.1."		
SC 5.5 Is the forested component of the wetland within the "100 year floodplain" of a river or stream?		
YES = Category II		
1 LS – Category II	Cat. II	
Category of wetland based on Special Characteristics		
Choose the "highest" rating if wetland falls into several categories.		
If you answered NO for all types enter "Not Applicable" on p.1
